2022-2026-CSE-C

Aim:

Five bikers compete in a race such that they drive at a constant speed which may or may not be the same as the other.

To qualify the race, the speed of a racer must be more than or equal to the average speed of all the 5 racers.

Take as input the speed of each racer and print back the speeds of qualifying racers.

Write a class Race with a method main(String[] args). The main method receives five arguments. You can write code to parse them into double data type.

For example, if the values 54.55, 53.57, 54, 56.25, 57.30 are passed as arguments to the main() method, then the output should be

```
The speed of the racers >= average speed 55.134 : 56.25 57.3).
```

Note: Make sure to use the **print()** method and not the **println()** method.

Source Code:

Race.java

```
class Race{
   public static void main(String args[]){
      double s1,s2,s3,s4,s5,avg;
      s1=Double.parseDouble(args[0]);
      s2=Double.parseDouble(args[1]);
      s3=Double.parseDouble(args[2]);
      s4=Double.parseDouble(args[3]);
      s5=Double.parseDouble(args[4]);
      avg=(s1+s2+s3+s4+s5)/5;
      System.out.print("The speed of the racers >= average speed "+avg+": ");
      if(s1>avg)
      {
         System.out.print(","+s1);
      }
      if(s2>avg)
         System.out.print(","+s2);
      }
      if(s3>avg)
      {
         System.out.print(","+s3);
      }
      if(s4>avg)
      {
         System.out.print(","+s4);
      }
      if(s5>avg)
      {
         System.out.print(","+s5);
      }
   }
}
```

Execution Results - All test cases have succeeded!

	Test Case - 1										
Use	r Output										
The	speed	of	the	racers	>=	average	speed	54.855999999999995:	,81.6,5	8.19,79.42	

Test Case - 2								
User Output								
The speed of the racers >= average speed 78.0032	: ,96.21,87.26,105.63
